AutoCAD is installed on over 35 million computers worldwide, with over 12 million licenses sold. AutoCAD has been included in Microsoft's Office bundle since Office 2010, along with the AutoCAD version that came with Office 2007 and Office 2003. In addition to AutoCAD, Autodesk also offers an AutoCAD LT drawing and design application that is smaller in scope, with only basic 2D drawing capabilities and limited 3D capabilities. History In 1982, Piers Taylor and Chuck Peddle were hired by Corel to work on what would later become AutoCAD. The product originally was called "AutoCAD DeskDrawer" but was renamed to AutoCAD when they decided to focus on the desktop version and desk-based publishing. Corel stated that the product would be a limited-feature, office-publishing program, and that they could not compete with existing CAD products like MicroStation and MicroPlan. In January 1983, AutoCAD came to market with a trial version. In the fall of 1983, Corel partnered with Digital Equipment Corporation (DEC), the company responsible for the popular PDP-10 minicomputers. Digital agreed to provide the basic program for free to any PDP-10 user who would also pay for a license to the operating system. However, Corel subsequently sued Digital and was awarded \$250,000 in damages after Digital's appeal failed. After this, the company created a licensing program for the PDP-10, and when the program proved successful, Corel integrated it into the product. With this addition, Corel was able to offer a full desktop version of AutoCAD for \$1,500 for the original PDP-10 version. In September 1984, the first Microsoft Windows version was made available. AutoCAD was bundled with Microsoft's DOS/Windows operating system, which allowed users to use the same application for both the desktop and the minicomputer. In 1985, Corel was bought by Novell, who then owned the brand name Corel, and the product was renamed CorelDRAW. At that time, 3D software for use on PC graphics cards was in its early stages of development, and was limited in capability. At the time of the purchase, Piers Taylor left Corel. Because CorelDRAW was the name of the company and not the product, this was what the first AutoCAD release was branded as. In the early 1990s, Core

In 1998, Autodesk Inc. acquired Evans & Sutherland, which was founded by engineer Bill Evans. Evans & Sutherland was later sold to DAISY (Digital Architects Information System Y) in 2004. The company produced a class library, J-LISP, that was a "precursor to AutoLISP". Evans & Sutherland was purchased by Autodesk in June 1998. Development in other fields The first documented instances of the term Lisp are by the American linguist, mathematician and philosopher John von Neumann and John McCarthy of Stanford University. John McCarthy founded the programming language LISP in 1958 and subsequently invented the Lisp Machine, a key enabler of the rise of the personal computer. LISP is a general-purpose programming language with its own syntax. The first Lisp Machine, the LINC, was a dedicated Lisp machine built by Lisp development company Symbolics. The Lisp Machine became the foundation of the entire Lisp family, as well as the basis for a complete computer system, the Lisp Machine operating system. The first commercial Lisp implementation, written in Lisp and published in 1966, was IMSL, which was written by John McCarthy and Gerald Sussman. The term Lisp was popularized through a paper written by John McCarthy titled "LISP: A New Language for Artificial Intelligence" that was published in the July, 1960 issue of the journal Communications of the ACM (JACM). McCarthy had been using Lisp before the paper and called it "protean programming". Lisp was promoted by Paul Graham in an influential essay from October, 2000. As a programming language, Lisp is not an object-oriented programming language, nor a class-based language, but a prototypical language in which the features, syntax, and language semantics of a class-based object-oriented programming language are still present. It also resembles functional programming languages. In its traditional usage, however, Lisp is most often associated with "procedural programming". Since then, Lisp has been adopted to support many other design paradigms. For example, Aspect-Oriented Programming (AOP) is based on LISP, and the functional programming paradigm has a number of implementations. Lisp is the core language of the functional programming language Haskell, and the LISP language or language family has also been adopted to implement other high-level programming languages such as C++. In recent years, Lisp has been applied to non-program a1d647c40b
