$$\partial_t u - D \Delta u = \sigma u(t) \dot{W},$$
 where \dot{W} is a white noise and $u(t,x)$ is the solution at time t and position x . In the case of the GSM model, σ is positive, and the reaction-diffusion equation is thus nonlinear. I would like to discretize this equation and truncate the solution at some maximum N layers, resulting in the equation
$$\partial_t u_i - D \Delta u_i = \sigma u_i(t) \dot{W}_i,$$
 where $i = 1, \dots, N$ and N is large (we are only interested in the interior layers where $x \approx 0$). The solution to this equation would then be given by
$$u_i(t) = u_i(0) \exp\left(\int_0^t \sigma u_i(t) \dot{W}_i dt\right).$$
 In practice, I would therefore expect that $u_i(t) = u_i(0) e^{3da54e8ca3}$
