The most popular CAD file formats on the market are DWG (Autodesk® AutoCAD® Drawing® file format), DXF (Autodesk® AutoCAD® Drawing® file format) and DGN (DGN file format), CAD formats widely used in the field of architecture, interior design and 3D graphic design. The main advantage of this type of file is the ability to keep the same structure when the object is converted into another format, which makes it convenient to edit and work with the data in the file. The DWG (AutoCAD® Drawing®) file format originated from the early 1980s when 2D CAD programs such as MicroStation, AutoCAD, Creo and FreeHand were released. With the introduction of the Internet, the popularity of this CAD format soared and by the year 2000, over 90% of all the CAD systems are using it. Currently, the popularity of the DWG format is declining, with some of the leading CAD programs such as AutoCAD and SolidWorks supporting the native.dwg file format. DWG is a proprietary file format used in AutoCAD (formerly known as AutoCAD LT). DWG is based on the ASCII text format and is the most widely used CAD format for technical drawings. The program reads a DWG file and stores all the data in a very structured way that allows users to change the contents or structure of a file very quickly. DWG files can have different names. For example, one program can support DWG files with a filename structure of A00-A99 (upper-case A's), B00-B99 (lower-case A's), C00-C99 (upper-case B's), D00-D99 (lower-case B's), E00-E99 (upper-case C's), F00-F99 (lower-case C's). The format can also include comments (called Section Notes). Comments are a list of special blocks of text at a particular section. They can be used to note changes, warnings or explanations. For example, "Handy Holds," "DWG CDX," "DWG Comment" and "DWG Section Comment" are popular AutoCAD DWG Extension. In some cases, comments can be added to the DWG file by using sections. For example, "Other comments." The presence of a DWG Comment Extension on a DWG file, if detected, can be ignored. Section a1d647c40b

In my UWP app, I want to get the sender of a push notification that's received. I've seen ways to do it on Android, but not UWP. I don't want to pull any secrets, it's ok to have a static string in my app. A: In addition to GetFromIntent, you can also use GetExtras(). You'll need to cast the extras to Microsoft.Bcl.AsyncInterfaces.NotificationExtras. private void HandleMessage(NotificationExtras notificationExtras) { var message = notificationExtras.GetString(Windows.ApplicationModel.DataTransfer.DataTransferOperation.Move); this.DisplayString = message; } Note that this requires API level 21 or higher. Q: Google Kibana in Elasticsearch or Apache Kafka If we want to analyze the data through google kibana like gmail, whats the need of using elastic search or apache kafka? A: I am not a fan of your question, but nevertheless here's my answer. Kibana is a product from Google, whereas Apache Kafka is a distributed, highly available messaging platform. Kibana serves as an interface to data (used for visualization and analysis) and provides the end user with search, dashboards and visualizations. You can use this for your own needs in the same manner as gmail. In order to use kafka with your own data, you'd need to use a messaging engine (e.g. Apache Kafka) or a data aggregation engine (e.g. Elasticsearch). You could use elasticsearch for data analysis and kafka for data ingestion. Here's a short description of the two. Apache Kafka is
