It can be used by students in architecture or constructions. The interface of the application consists of two windows - one of them displays the building while the other is a Command Prompt window that shows logging details. So, you can select one of the 25 building models, such as Eternity Plaza, Observation Tower, Palace Hotel, Sears Tower, and Simple (with multiple doors, glass elevator, basements, 500 floors etc). A third window represents a simulator control panel where you can view technical information on the design, such as the current camera floor, position and rotation, number of elevators, clicked position and frame rate. Plus, you can disable collision detection, gravity, elevator processing, automatic shafts and stairs, among others. In addition, you can view altitudes, enable or disable objects in real-time (global, per-floor, grouped), configure camera control options, edit elevator settings, check out simulator statistics, as well as use a script console and view object information. The program runs on a moderate amount of system resources, has a good response time and worked smoothly during our tests. It takes a while for a 3D environment to load but that's normal. No error dialogs have popped up during our tests and Skyscraper did not freeze or crash. Unfortunately, there is no help file available and no recent updates have been made. The application was designed to let the user explore different types of skyscrapers, such as the model of the Sears Tower or the Japanese Naramata Place, and simulate them in a virtual building. All models are in architectural 3D view. They show the perspective of the observer, who is located a bit above the structure and the observer's ground plane is parallel to the ground. The user can rotate the structure and zoom in or out. The models have 12 practical floor planes, a maximum building height of 4,244 meters, a building width of 106 meters, a maximum width of 105 meters, as well as a maximum length of 500 meters. The 3D building models are usable by anyone, regardless of architecture or construction background. The user interface consists of two windows - one that displays the building while the other is a Command Prompt window. In addition, you can select and enable multiple objects in the virtual environment, per floor and per group. The application provides a simulator control panel where you can view technical information and various simulation settings. Advantages: Completely opensource Additional features: Useful as a tool to get a general impression of the model as a whole Option to disable collision detection Option to disable gravity Option to enable or disable elevator processing Option to disable/enable automatic shafts Option to disable/enable stairs Option to configure camera control options Option to check out simulator statistics Option to use a script console and view object information Can be used for educational purposes Can be used to simulate models Uses i3D models Intuitive user interface In-depth explanatory help for configuration of the application Technical information and diagrams Disadvantages: No help file available Very little content updates The application can be installed in a computer running Windows 7 or 8.1. Learn how to create your own building designs in 3D, using the Skyscraper3D Builder and Skyscraper Designer software applications. Both of the programs contain over 26 views for each building type and allow you to rotate the camera around the building from 360 degrees to zoom in on any part of the structure. The Skyscraper3D Builder gives you access to a library of over 4,000 building models including all major buildings such as Empire State Building, Burj Khalifa and Makkah Mosque. You can quickly and easily select the desired model, change the design and editing features (architectural elements, textures, lighting, etc.), and then preview or create a building construction with a click of the mouse. The application includes features for adding custom elements such as windows, doors, railings, ventilation, and more. Each of the added elements can be edited and changed, scaled, rotated or moved. You can also select from different material images to add texture and style to the model. The Skyscraper Designer allows you to work with models created by the Skyscraper3D Builder and features over 400 building models, including the Shanghai World Financial Center. You can share models with friends, import standard room layouts and create floorplans. The Skyscraper Designer allows you to select the desired view with rotation from 360 degrees and includes features for working with rooms, windows, textures and more. You can view the model from various angles and zoom in to view individual elements. Pretty simple indeed. Use the app to experiment what you can accomplish with the building model, but I would urge the importance of knowing the 3D modeling process. From "3D modeling" (not "building design" in terms of learning) to basics of C++, coding, C# and software development stuff. I've seen people who dabble into 3D modeling, but never get the grip on the fundamentals. When you try to see the opening of the program, there is no final view and no way to close the window, so, it was impossible for me to see the building's design. The program gave me a message with the following text: "The Articulated-Link animation feature has not been implemented at this time. We apologize for this inconvenience" I was very impressed with the image quality and the fact that it included models of 25 highly recognized and used buildings worldwide. The only drawback is that I'm not able to create any. I'

What's New in the Skyscraper?

Skyscraper is an educational application that lets you explore multiple types of buildings in a 3D environment, similar to a 3D video game. It can be used by students in architecture or constructions. This application is not a standard building design software, and it has no features that allow to create a 3D model from scratch. Instead, it lets you explore the design of existing buildings, similar to a 3D video game. The main interface consists of two windows, one of which displays the building while the other shows the relevant data (logging details, collision information, and more). The simulator window provides a visual display of the architectural design, such as the current camera level, position and rotation, number of elevators, clicked position and frame rate, among others. The option window is the console from which you can disable collision detection, gravity, elevator processing, automatic shafts and stairs, among others. You can also configure camera control options, view the global and per-floor object status, configure elevator settings, check out the simulator's statistics, execute scripts, view object information, and so on. If you wish to display additional information about the project, you can use the object window. You can also view the project level map, view the floor levels or floors detailed information, edit the objects properties or permissions, view the object status, and so on.
